# NOMENCLATURE OF RHOMBUS

The part of a plane enclosed inside a rhombus is called **surface**.

The line segments which bound a rhombus are called *sides*.
Each side of a rhombus takes the name of **base**.

The perpendicular line drawn between two opposite sides of a rhombus is called the **altitude**.
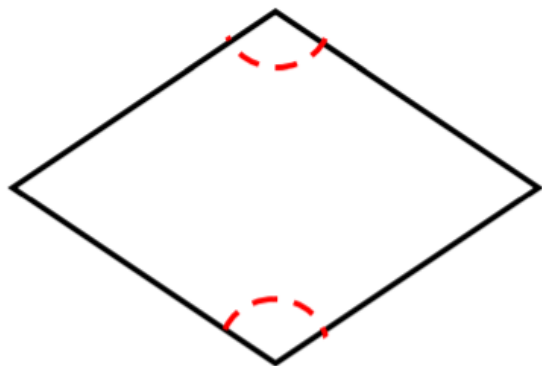

Each line segment which joins opposite vertices of a rhombus is called a **diagonal**.

The total of the sides of a rhombus is called the *perimeter*.

The points where two sides
of a rhombus meet are
called *vertices*.

Each part of the plane enclosed between two consecutive sides of the rhombus is called an *angle*.
