

RELATIONSHIP BETWEEN ANGLES

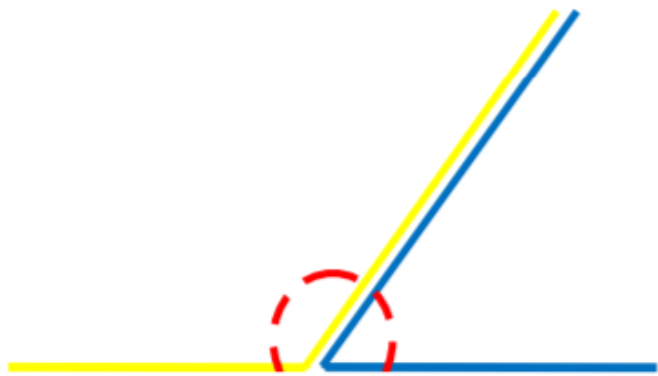

Two angles with a common side are called *adjacent*.

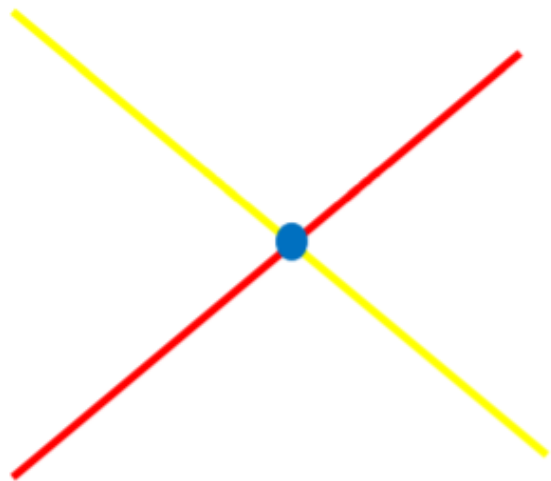

Two angles which share a vertex and whose sides come together to make continuing lines are called *linear pair*.

Two angles whose sum is equal to a right angle therefore equal to 90° are called ***complementary angles***.

Two angles whose sum is equal to a straight angle therefore equal to 180° are called *supplementary angles*.

Two adjacent angles whose non-common sides form a straight angle are called *vertically opposite*.
